

Route 4 & 17 Interchange Reconstruction

The Route 4 & 17 Interchange, originally built in 1932, is a main transportation connector carrying more than 220,000 vehicles on a daily basis and ranks among the most congested in the northeast.

The major construction elements of this project consisted of: two new third level direct flyover ramps (325 - and 265 - meters - long); reconstruction of an existing loop ramp; widening and reconstruction of Route 4 & Route 17; extensive relocation of utilities; and, construction of an auxiliary interchange and a new service road. This extremely complex project required special attention to scheduling, MPT and community outreach. The construction of this \$60 Million project from a three and a half year time frame to **13 month** super-accelerated schedule required an extremely experienced, knowledgeable and flexible inspection staff.
